AI Usage and Individual Contribution Report

Project: Algorithms, Data Structures & Connectionist AI
Team: K.I.V.A.S. | Beijing Institute of Technology
Member: Huseyn (Hüseyin / Hüseyn) | **Role:** Content Lead
Reporting scope: Content-development interactions available in this conversation

1. My responsibility

As Content Lead, my task was to develop clear, beginner-friendly English educational material for the team's full teaching presentation. My focus included selecting a logical sequence of topics, drafting explanations and worked examples, and specifying suitable diagrams for the visual designer. The project covers algorithms, data structures, and connectionist AI.

2. How I used AI

I used ChatGPT as a drafting and structuring assistant. I requested a complete lesson rather than a short project-plan presentation; asked for simpler, more detailed explanations; and requested visual guidance for each slide. AI-generated text was a **draft for review**, not independent evidence that the material was verified or submitted.

3. Prompt and response evidence

The prompts below are copied from my visible messages. AI responses are **accurate summaries** rather than full verbatim transcripts. The attached chat history and the 30-slide text file provide the longer response evidence.

Interaction 1 — My actual prompt

"bizim qrupAlgorithms, Data Structures & Connectionist AI budu bizim movzu"

AI response / resulting draft: I specified the project subject. ChatGPT used this scope to plan a lesson on algorithms, data structures, and connectionist AI.

Interaction 2 — My actual prompt

"biz bele dushunmuruk tam dersi izah etmeliyik en az 20 sehife"

AI response / resulting draft: I clarified that the team needed a full teaching lesson, not a brief project presentation. ChatGPT proposed a 30-slide teaching structure.

Interaction 3 — My actual prompt

"indi mene her layd ucun yazilari ver"

AI response / resulting draft: I requested slide-by-slide text. ChatGPT drafted English content for the introduction, searching/sorting, common data structures, neural networks, practice questions, and references.

Interaction 4 — My actual prompt

"onu yox verdiyin melumatlar tam basha dusulen ideal ve asan formada ayaz ve harada ne shekli nece diaqraqm qoyulacaginida de"

AI response / resulting draft: I asked for explanations understandable to beginners and precise image/diagram placement. ChatGPT expanded the teaching text and added slide-specific visual-design directions.

Interaction 5 — My actual prompt

"verdiyin yazilara uygun slaydi qur"

AI response / resulting draft: I asked for a presentation matching the draft. ChatGPT provided a PowerPoint deliverable in the conversation.

Interaction 6 — My actual prompt

"bize bu yax ders kececeyimiz slaydi duzeldirik"

AI response / resulting draft: I corrected the scope again: this was the main lecture, not the five-slide team project plan. ChatGPT restated the full teaching presentation structure.

Interaction 7 — My actual prompt

"bunan davam edirik"

AI response / resulting draft: I supplied the 30-slide teaching text as the continuing source. ChatGPT confirmed it would preserve the topic sequence and improve explanations, visuals, examples, and presenter notes.

Interaction 8 — My actual prompt

"etrafli ver sene atdigim kimi"

AI response / resulting draft: I requested an expanded version following the supplied text. ChatGPT returned a detailed 30-slide draft with English slide content, worked examples, visual directions, and speaker notes.

4. Educational content produced with AI assistance

Slides 1–5: introduction, learning objectives, computer science foundations, how the three topics connect, and algorithm definitions.

Slides 6–12: everyday algorithms, pseudocode and flowcharts, linear and binary search, sorting, and Big O notation.

Slides 13–20: arrays, linked lists, stacks, queues, trees, graphs, and selecting appropriate data structures.

Slides 21–27: connectionist AI, biological versus artificial neurons, weighted sums, ReLU example, network layers, training, and limitations.

Slides 28–30: review questions, answers, key takeaways, and references.

5. Examples and diagrams specified

The draft included an array-by-array Linear Search example (find 7 in [4, 2, 9, 7, 1]), Binary Search (find 15 in [3, 6, 9, 12, 15, 18, 21]), array indices, linked-list pointers, stack and queue operations, tree and graph diagrams, and a simple artificial neuron calculation: (2 × 0.5) + (3 × 0.2) + 0.1 = 1.7, with ReLU output 1.7.

6. My decisions and contribution

I selected and confirmed the project topic, specified that the deliverable must teach the full lesson, insisted on at least 20 slides, requested beginner-friendly explanations, and directed that each slide include appropriate visuals and diagrams. I also supplied the 30-slide text as the baseline for further expansion. These are my visible instructions; the detailed English prose and many design suggestions were AI-assisted drafts.

7. Verification and remaining work

Before submitting the teaching materials, our team should check technical correctness against the listed textbooks, test all worked examples, ensure diagrams match the explanations, and align the slides with the reviewed Markdown source. **This report does not claim those checks are already complete.** Team members should document their own contributions separately.

8. Evidence and transparency note

Evidence available: the ChatGPT conversation containing the quoted prompts and responses; the user-supplied file "Pasted text(1).txt" containing the 30-slide English outline; and presentation drafts created during the conversation. This report is a selective record of relevant interactions, not a complete verbatim chat export. No screenshots, GitHub commits, or independent fact-check records are included here.
